O2 DQ framework tutorial introduction: idea, structure and running

Michael Winn

Department of Nuclear Physics IRFU/CEA, university Paris-Saclay based on material by Ionut Arsene (University of Oslo)

O2 Tutorial DQ session, 08.11.2023

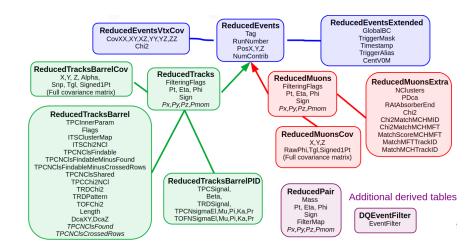

Further detailed material and support

- ► Today only a short presentation to allow you to work with the framework
- detailed presentation by Ionut and others in DQ meeting in 05/2022 link
- material in last DQO2 tutorial link
- please subscribe to alice-pwg-DQ-O2@cern.ch (weekly meetings on Thursday at 11 AM CET)
- ▶ in case of further questions beyond the tutorial, use mattermost channel: ´O2-DQ Analysis Framework Alpha´

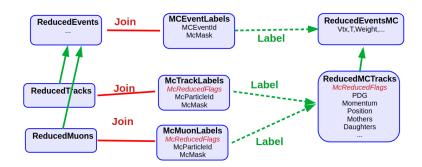

Idea and scope of framework

- Scope: all analyses with single or dileptons (electrons & muons) as part of analysis
- dilepton + 1/2 track(s) (correlations and b-decays), flow measurements, multiplicity dependent measurements,..
- hence: scope DQ, EM dileptons, single-lepton based HF analyses, extendable to UD
- realised via modularized derived data
- embedded in a hierarchical running strategy

The O2 DQ Data model

The O2 DQ Data model: MC labelling

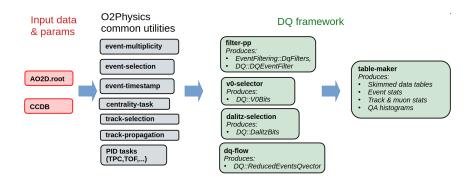

- MC generator level information can be retrieved via MC "labels", joinable to the event, track and muon tables
- Using a skimmed MC model allows for large data size reduction (work with just particles of interest)

Running philosphy

- Run 3: large data volumes implied by increase of luminosity and ALICE high-granularity detectors
- 2-3 levels of data reduction within framework to provide relatively small size output including all information needed for analysis with full luminosity
- trigger layer processing using filter-pp: filter-pp-task (software trigger), based on simple, inclusive single and dilepton signatures
- centralised hyperloop to produce derived data with table-maker: reading AO2D, writing reducedAod.root
- user-based running on derived data table reader: reading reducedAod.root, writing trees/histograms to analyse
- final output contains candidates and auxiliary sets of tracks (V0 tracks, dalitz leptons)

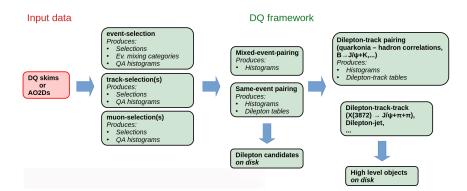

First employed for QM2023 preliminaries with pp 2022 data, being adapted for other data sets

Skimming Workflow

- Produces a "skimmed and slimmed" data model
- Configurability for
 - selecting events, tracks and muons with multiple parallel selections
 - Amount of event/track/muon information
 - \rightarrow allows also to do analysis on derived data beyond single leptons/dileptons

Analysis workflow

- Runs analysis over DQ skims or Framework/AO2D
- Can replay event/track selections but also use bits based on decisions computed at skimming time
- ▶ Produces high level skims for "offline" applications, e.g. machine learning

Structure of an analysis task in code

From PWGDO/Tasks/tableReader.cxx 185 ▼ struct AnalysisTrackSelection { Data tables being produced Produces<aod::BarrelTrackCuts> trackSel; OutputObj<THashList> fOutputList("output"); // The list of cuts should contain all the track cuts needed later in analysis, including 187 Output object (e.g. list of // for candidate electron selection (+ eventual prefilter cuts) and other needs like quarkonium - hadron correlation 190 histograms) // NOTE: For now, the candidate electron cuts must be provided first, then followed by any other needed selections 191 Configurable-strings (Configudts['ctgTrackCuts', 'jps:PDI', 'Comma separated list of barrel track cuts'); Configurable-bools 'Configudf'crgdA', 'false, 'If true, fill OA histograms'); Configurable-std:strings 'Configudf'crdAklistogram' ("GoddfrackHistogram', ", 'Comma separated list of histograms'); 192 Configurables (user input 193 194 195 parameters) 196 HistogramManager* fHistMan; 197 std::vector<AnalysisCompositeCut> fTrackCuts; 198 199 void init(o2::framework::InitContext&) 288 ▼ Initialization function (run once 201 TString cutNamesStr = fConfigCuts.value: 202 ▼ if (!cutNamesStr.IsNull()) { when the task is created) 203 std::unique ptr<T0bjArray> objArray(cutNamesStr.Tokenize(",")); 204 ▼ for (int icut = 0; icut < objArray->GetEntries(); ++icut) { 205 fTrackCuts.push back(*dgcuts::GetCompositeCut(objArray->At(icut)->GetName())); 206 207 208 VarManager::SetUseVars(AnalysisCut::fgUsedVars): // provide the list of required variables so that VarManager knows what to fill 209 210 ▼ if (fConfigOA) { VarManager::SetDefaultVarNames(): fHistMan = new HistogramManager("analysisHistos", "aa", VarManager::kNVars); fHistMan->SetUseDefaultVariableNames(kTRUE): fHistMan->SetDefaultVarNames(VarManager::fgVariableNames, VarManager::fgVariableUnits); TString histDirNames = "TrackBarrel BeforeCuts:": 218 ▼ for (auto& cut : fTrackCuts) histDirNames += Form("TrackBarrel %s;", cut.GetName()); DefineHistograms(fHistMan, histDirNames.Data(), fConfigAddTrackHistogram); // define all histograms VarManager::SetUseVars(fHistMan->GetUsedVars()); 224 fOutputList.setObject(fHistMan->GetMainHistogramList());

Structure of an analysis task in code

From PWGDQ/Tasks/tableReader.cxx

```
228
        template <uint32 t TEventFillMap, wint32 t TTrackFillMap, typename TEvent, typename TTracks>
229
       void runTrackSelection(TEvent const& event, TTracks const& tracks)
230 ▼
         VarManager::ResetValues(0, VarManager::kNBarrelTrackVariables):
232
         // fill event information which might be needed in histograms/cuts that combine track and event properties
         VarManager::FillEvent<TEventFillMap>(event);
235
         trackSel.reserve(tracks.size()):
236
         uint32 t filterMap = 0;
         int iCut = 0;
238
239 ▼
         for (auto& track : tracks) {
248
           filterMan = A:
           VarManager::FillTrack<TTrackFillMap>(track):
241
           if (fConfigQA) { // TODO: make this compile time
242 ▼
243
             fHistMan->FillHistClass("TrackBarrel BeforeCuts", VarManager::fgValues);
244
245
246
247 ▼
           for (auto cut = fTrackCuts.begin(); cut != fTrackCuts.end(); cut++, iCut++) {
248 ▼
             if ((*cut).IsSelected(VarManager::fgValues)) {
249
               filterMap |= (uint32 t(1) << iCut);
                                                                                            "process" function:
               if (fConfigQA) { // TODO: make this compile time
250 ▼
                fHistMan -> FillHistClass(Form("TrackBarrel as", (*cut), GetName()), VarNamager::fgValues

    Arguments specify required input data

252
                                                                                                tables
255
           trackSel(static cast<int>(filterMap)):
256

    Frequency of running depends on the

258
259
        void processSkimmed(MyEvents::iterator const& event, MyBarrelTracks const& tracks)
                                                                                                input arguments
260 ▼
261
         runTrackSelection<gkEventFillMap, gkTrackFillMap>(event, tracks):

    Multiple process functions allowed

262
       void processDummy(MyEvents&)
264 ▼
265
         // do nothing
                                                                                                             Process switch: switch on/off
266
267
       PROCESS SMITCH/ManalysisTrackSelection, processkimed, "Run barrel track selection on DQ skimmed tracks", false tasks / process functions
268
269
       PROCESS SWITCH(AnalysisTrackSelection, processDummy, "Dummy function", false);
```

Generic structure of workflows in O2

- A workflow is a collection of tasks (or DPL devices) running simultaneously in a shared memory environment
- ► Each task / device must specify:
 - Inputs (data tables, other resources)
 - Outputs (data tables, histograms, etc)
- Can have:
 - Specific initialization function: init()
 - Configurable input parameters: Configurable
 - Other data or function members
- DPL framework organizes/optimizes the chain of running the different tasks based on the specified inputs and outputs

Running a workflow in O2

- Main requirements for the user:
 - Select the needed tasks to be run in the workflow
 - Specify the configuration of each single task / device in the workflow in order to achieve the analysis goals
- Required tasks can be found in the same O2 executable or in different ones
 - Multiple O2 executables can be combined in a pipe:
 o2-analysis1 | o2-analysis2 | ...
- ► The user must ensure that the workflow can run, i.e. all needed inputs can be read from input files or can be produced by the specified workflow devices

Running a workflow in O2

- Configuring and running a workflow can be a very laborious and error prone process due to many tasks that usually need to be run, so:
 - Task configuration is done using (predefined) .json files, and
 - Workflows are typically run using python scripts
- Example of a command line run without the help of scripts: o2-analysis-dq-table-maker-mc -configuration json://tempConfig.json -severity error -shm-segment-size
 1200000000 -aod-writer- json aodWriterTempConfig.json -b | o2-analysis-timestamp -configuration
 json://tempConfig.json -b | o2-analysis-event-selection configuration json://tempConfig.json -b |
 o2-analysis-multiplicity-table -configuration json://tempConfig.json -b | o2-analysis- trackselection
 -configuration json://tempConfig.json -b | o2-analysis-pid-tof-base -configuration json://tempConfig.json
 -b | o2- analysis-pid-tof -configuration json://tempConfig.json -b | o2-analysis-pid-tof-full -configuration
 json://tempConfig.json -b | o2- analysis-pid-tof-beta -configuration json://tempConfig.json -b |
 o2-analysis-pid-tpc-full -configuration json://tempConfig.json -b | o2- analysis-track-propagation
 -configuration json://tempConfig.json -b
- Example of command line using a python script:
 - ./runTableMaker.py -runMC –arg internal-dpl-aod-reader:aod-file:AO2D.root configTableMakerMCRun3.json –add_track_prop

```

- All tasks in the workflow need to have a specified configuration in .ison file
 - Specify the configurables and process functions
- See e.g. for the track selection task shown in slides 5-6
- N.B. When a task is included in the workflow, at least one process function must be active
 - Sometime if we want to switch off a task from an executable that is being run, we enable a process function named "processDummy" which does nothing

A .json reader/writer configuration

```

                                                                                                                           "table": "AOD/REVTXCOV/0",
                                                                                                                               "table": "AOD/REGVECTOR/0",
                                                                                                                               "table": "AOD/REDUCEDTRACK/8".
                                                                                                                           "table": "AOD/RTBARREL/0",
                                                                                                                           "table": "AOD/RTBARRELCOV/0",
                                                                                                                               "table": "AOD/RTBARRELPID/0",
                                                                                                                           "table": "AOD/RTMUON/0",
                                                                                                                           "table": "AOD/RTMUONEXTRA/0",
                                                                                                                               "table": "AOD/DALITZBITS/0".
```

- A reader/writer configuration file specifies the data tables to be read from or written to disk
 Needed when one works with data models other than the central O2/Framework model
- The file can specify just the table identifier or it can specify detailed information, e.g. customized names for each data member in a table
- ► These files are typically needed when:
 - Analyzing skimmed data Writing skimmed data to disk

The goals of this tutorial

- Understand the way workflows are configured
- ▶ get familiar with hyperloop configuration
- Analyze the skims
 - Simple Dilepton analysis
 - Run over MC and match reconstructed and generator level objects
- Be aware of auxiliary tools
